Water in California

Recently, shortage of water is one of the big problems in California. In 2013, researcher said the air was the driest up until now because the amount of rain was lowest, which is about 180m although average precipitation was 560m. Also, there is not enough water to drink. Water of California State is depending on the Sierra Lake, which decreased about 33 percent because of the shortage of rain. The main cause of this problem is shortage of rain because California has rain less than other areas in the United States. Moreover, melt water also decreased because the amount of snowfall decreased. In this state, there are a lot of mountains, so people are depending on the mountain's water. However, there was a little snow in a few years, so people cannot ensure certain water. Additionally, if this problem continues, some bad effect might occur. For example, the price of not only water but also many other products like vegetable will continue to increase. The reason is that farmers absolutely need water. In addition to the effect, it can badly affect the economy, especially agriculture will see the impact because they cannot cultivate their products without water. However, we have to solve this problem as much as we can, and we can come up with some solutions. First, we have to reuse water, which means using recycled the water. However, if we want to do that, we have to reconsider the water system because present water system is hard to remake new clean water. Second, everyone has to recognize how this problem is serious, and

then they should try to keep saving water as much as they can because small effort is essential to change big things. That is why everyone has to start to do what they can do today.
